- Effortlessly compose styles
- Encourages working with a theme, makes it easy
- Using props-types to enforce styling
- Responsive, Mobile-first styling made trivial
- Easy to sprinkle into existing projects
- Works with styled-components and other css-in-js libraries (emotion, glamourous)

- Shaky TypeScript support (for now)
- Unable to change prop names without some work
- Can become difficult to decide when to seperate functional props from styling props
